

IN THE CLAIMS

Please amend the claims as follows.

C' 1. (Previously Amended) Vertically joined flooring material comprising floor boards with a polygonal shaped upper surface, which floor boards are provided with edges, a groove, a lower side and a decorative top surface, whereby the floor boards are intended to be vertically joined by means of separate joining profiles, wherein at least one edge is provided with one groove, which groove is arranged parallel to its respective edge and that the joining profiles are provided with lips arranged in pairs, which lips each are intended to be received by the groove of a respective floor board so that adjacent floor boards with the grooves at the adjacent edges are guided and fixed horizontally by the lips of the joining profile, which lips are connected to each other by a middle section of the joining profile and that the joining profile is provided with a central cheek section which is comprised by a first and a second independently resilient cheek which cheeks are provided with one tongue each whereby the tongues are intended to be received by one groove each so that adjacent floor boards are guided in a vertical direction.

2. (Currently Amended) Vertically joined flooring material according to claim 1, wherein the groove of the floor board is on the lower side and is arranged at a distance from the closest edge less than half of the width of a floor board.

3. (Previously Amended) Vertically joined flooring material according to claim 2, wherein the floor boards are provided with a groove at the edges and that the distance between each groove and the closest edge is about the same.

4. (Previously Amended) Vertically joined flooring material according to claim 2, wherein the part of the floor board located between each edge and its respective groove is thinner than the maximum thickness of the floor board by means of a recess located on the lower side.

5. (Previously Amended) Vertically joined flooring material according to claim 1, wherein the distance between a center ~~the centers~~ of one lip ~~the lips~~ to a center of the second lip of the joining profile is less than the distance between a center ~~the centers~~ of one ~~the~~ grooves groove to a center of the second groove placed on each side of and closest to the edge of two adjacent floor boards.

6. (Previously Amended) Vertically joined flooring material according to claim 1, wherein the joining profiles are manufactured in long sections which may be cut into a desired length exceeding the length of a floor board before being cut.

7. (Previously Amended) Vertically joined flooring material according to claim 1, wherein the joining profiles are partially coated with glue or adhesive tape.

8. (Previously Amended) Vertically joined flooring material according to claim 1, wherein a decorative strip is positioned in an intentional gap formed between two floor boards.

9. (Previously Amended) Vertically joined flooring material according to claim 8, wherein the decorative strip is provided with heels on its lower part to interact with corresponding depressions on the joining profile.

10. (Previously Amended) Vertically joined flooring material according to claim 8, wherein the decorative strip is provided with shoulders to rest against the upper edges of the joining profile.

11. (Currently Amended) Vertically joined flooring material according to claim 1, wherein the grooves on the lower side are arranged at a distance from the closest edge less than one quarter of the width of the a floor board.

12. (Previously Added) Vertically joined flooring material according to claim 1, wherein the top surface of the floor board is flush with the top surface of an adjacent floor board, and the lower side of the floor board is flush with both the lower surface of the adjacent floor board and the joining profile.

13. (Currently Amended) Joining profile comprising:
two upstanding lips, disposed at opposite ends of and perpendicular to a middle section, such that the middle section terminates with the upstanding lips;

a central cheek section, said central cheek section comprising first and second independently resilient cheeks;

each of said first and second resilient cheeks comprising a tongue, extending perpendicular with respect to said respective cheek.

14. (Previously Added) Joining profile according to claim 13, wherein said first and second resilient cheeks are separated by a space, said space large enough to permit deflection of one of said first and second resilient cheeks without contacting the other of said first and second resilient cheeks.

15. (Previously Added) Joining profile according to claim 14, further comprising a decorative strip, disposed between said first and second resilient cheeks.

16. (Previously Added) A method of joining flooring material, comprising:
providing a first and a second floor board, the floor boards comprising:
edges, the edges being provided with a first groove;
a lower side; and
a decorative top surface,
wherein each of the edges are provided with a second groove, arranged parallel to its respective edge;

Can't *Not* providing a joining profile, the joining profile comprising:
lips, arranged in pairs, separated by a middle section; and
a central cheek section, comprising first and second independently resilient cheeks, the first and second resilient cheeks each comprising a tongue;
vertically joining the first floor boards with the joining profile, by partially inserting one lip of the joining profile into the second groove of the floor board, while simultaneously deflecting one of the first and second resilient cheeks; and
fully seating the lip into the second groove, while simultaneously allowing the one of the first and second resilient cheeks to return to its non-deflected position.

17. (Previously Added) The method of claim 16, further comprising:
vertically joining the second floor board with the joining profile, by partially inserting the other lip of the joining profile into the second groove of the second floor board, while simultaneously deflecting the other of the first and second resilient cheeks; and
fully seating the lip into the second groove, while simultaneously allow the other first and second resilient cheeks to return to its non-deflected position.

18. (Previously Added) The method of claim 17, wherein said fully seating of the second floor board causes the top surface of the first floor board to be flush with the top surface of the second floor board, and the lower side of the both first and second floor boards to be flush with the joining profile.

19. (Previously Added) The method of claim 16, further comprising inserting a decorative strip between the first and second resilient cheeks.

20. (Previously Added) Vertically joined flooring material according to claim 1, wherein the upper surface of the floor boards have a shape selected from the group consisting of square, rhombus and rectangle.

AMENDMENT AFTER FINAL

U.S. Appl. No. 09/806,941

Page 6

21. (Previously Added) Vertically joined flooring material according to claim 1,
wherein the floor boards are partially coated with glue.
